

UPM ProFi® Design Rubber Strip

Rubber strip for creating a closed surface decking

UPM ProFi Design Rubber Strip (12 x 13 mm, length 50 m) is designed for 6 mm gaps between UPM ProFi Deck boards. The joint tape offers optimal protection against dirt falling between and under the decking boards. The high-quality EPDM material (ethylene-propylene-diene rubber) is resistant to environmental factors such as UV radiation, moisture, cold and heat.

Installation

When installing the rubber strip, please ensure that you do not pull the tape in length when inserting into the joint. Then the rubber strip would contract later and the rubber strip would be too short at the ends. It is recommended first to overlap the rubber strip at the edges a few centimetres and only to cut adequately at the end of the installation when it has reached its original length. Please ensure sufficient ventilation underneath the decking boards. Material need: about 6.5 lm per m².

UPM ProFi Design Rubber strips are developed for terraces built with UPM ProFi Deck. If you use the rubber strips together with Lifecycle or Veranda decking boards, some modifications of the tape are needed. Please ask your distributor for further information.
